

What do you Really know about 2+2 engine wiring ?

Posted by hdclo - 2012/07/27 22:39

. . Ok, , I have a '68 Parisienne 2+2. . 327 engine. . When I bought the car the temperature idiot light did not work. . Come to find out the temp sending unit did not have a wire running to it. . A quick check around failed to find it. . I thought when I pulled the engine for rebuild I would find it. . No luck. . Can not find anything that resembles a broken wire coming from any of the wire looms. .
. . Any ideas where that wire is supposed to be? ? :S

I'm no expert on Canadian cars - you might have luck at the Canadian Poncho forum .

Does this have Hot & cold light?? If only hot there should be a "green wire in Harness you'll have to strip some of the harness back as they likely cut & buried it in there. Temp switch may have been in left side cyl.head or up on intake. depends if parts have been swapped??? Pete
